

Significant turbulence occurs in the plume exiting the Serductor® nozzle. There is a Multiplier Effect - for every litre pumped in, agitation flow is 5 times greater than the volume of liquid at the inlet.

Serductor® Agitation prevents particulates from settling on the tank bottom, a sweeping action can be introduced to keep solids in suspension making it easier for a filtration system to operate more effectively. Reduces the possibility of contamination and achieves improved quality.

More than 400 customers, over 2000 process tanks. Expertise to guarantee improved quality and a perfect finish.

Five Times More Out

■ Fluted Angular Nozzle

The profile is designed to generate a wider range and a more penetrating dispersion plume.

■ Original Serfilco Innovation

to the Metal Finishing and PCB industry. Expertise of literally hundreds of installations to guarantee perfect results and improve quality.

■ Replace Air Agitation

Low cost alternative to air, also extremely beneficial in previously non-agitated processes, such as acid dips, cleaners and rinses.

■ Benefits can be realised

Virtual elimination of fumes emission, more even distribution, less chemical additions, savings on heating bills and faster plating, short payback period guaranteed.

■ Correct sizing is paramount

Selection of a pump with adequate flow rate and pressure head capability is critical, together with number and positioning of nozzles. Consult the innovators of this technology for installation advice and expertise.
